

LIST OF CURRENT CLAIMS

1. (Previously Presented) A clamping apparatus, wherein

a central pillar (12) is projected from a reference member (2) so as to be inserted into a hole (5) opened in a movable member (3),

the central pillar (12) is provided with an inclined outer surface (13) that gets closer to the axis toward a leading end of the projecting direction,

an annular intermediate member (15) in which at least a part of the circumferential direction is allowed to deform in both the expanding direction and contracting direction is arranged at the outside of the inclined outer surface (13), the intermediate member (15) is provided with a straight outer surface (16) allowed to fit to an inner peripheral surface of the hole (5) and with an inclined inner surface (17) facing the inclined outer surface (13),

a pull member (21) is inserted into the central pillar (12) axially movably, and the pull member (21) is connected to the intermediate member (15),

a lock means and a release means are provided in the reference member (2), the lock means moves the intermediate member (15) via the pull member (21) toward a base end for locking and the release means moves the intermediate member (15) via the pull member (21) toward the leading end for releasing,

a fluid flow hole (38) is opened in the straight outer surface (16) of the intermediate member (15), and when the intermediate member (15) moves for locking and the straight outer surface (16) comes into close contact with the inner peripheral surface of the hole (5), the fluid flow hole (38) is closed by the inner peripheral surface of the hole (5).

2. (Withdrawn) A clamping apparatus, wherein

a central pillar (12) is projected from a reference member (2) so as to be inserted into a hole (5) opened in a movable member (3),

the central pillar (12) is provided with an inclined outer surface (13) that gets closer to the axis toward a leading end of the projection direction,

a plurality of pressing members (43) that are radially movable are arranged at the outside of the inclined outer surface (13), and the pressing member (43) is provided with a straight outer surface (16) allowed to fit to an inner peripheral surface of the hole (5) and with an inclined inner surface (17) facing the inclined outer surface (13),

a pull member (21) is inserted into the central pillar (12) axially movably, and the pull member (21) is connected to the pressing members (43),

a lock means and a release means are provided in the reference member (2), the lock means moves the pressing members (43) via the pull member (21) toward a base end for locking, and the release means moves the pressing members (43) via the pull member (21) toward the leading end for releasing,

a fluid flow hole (38) is opened in the straight outer surface (16) of the pressing member (43), and when the pressing member (43) moves for locking and the straight outer surface (16) comes into close contact with the inner peripheral surface of the hole (5), the fluid flow hole (38) is closed by the inner peripheral surface of the hole (5).

3. (Withdrawn) A clamping apparatus, wherein

a central pillar (12) is projected from a reference member (2) so as to be inserted into a hole (5) opened in a movable member (3),

an inner sleeve (61) which is radially expandable and contractible is supported on the central pillar (12) movably along the axis of the central pillar (12), and a tapered outer surface (13) is formed on an outer peripheral surface of the inner sleeve (61),

an outer sleeve (71) which is radially expandable and contractible is arranged at the outside of the inner sleeve (61), a tapered inner surface (17) allowed to make a tapering engagement with the tapered outer surface (13) is formed on an inner peripheral surface of the outer sleeve (71), a straight surface (16) allowed to fit to an inner peripheral surface of the hole (5) is formed on an outer peripheral surface of the outer sleeve (71),

an advancing means (25) which presses the inner sleeve (61) in such a direction as to tighten the tapering engagement is provided,

a fluid flow hole (38) is opened in the straight outer surface (16), and when the straight outer surface (16) comes into close contact with the inner peripheral surface of the hole (5), the fluid flow hole (38) is closed by the inner peripheral surface of the hole (5).

4. (Withdrawn) A clamping apparatus, wherein

a central pillar (12) is projected from a reference member (2) so as to be inserted into a hole (5) opened in a movable member (3),

an intermediate member (15) which is radially expandable and contractible is supported on the central pillar (12) movably along the axis of the central pillar (12),

a tapered fitting surface (16) is formed on an outer peripheral surface of the intermediate member (15), a tapered inner surface (17) allowed to make a tapering engagement with the tapered fitting surface (16) is formed on the hole (5),

an advancing means (25) which presses the intermediate member (15) in such a direction as to tighten the tapering engagement is provided, and

a fluid flow hole (38) is opened in the tapered fitting surface (16), and when the tapered fitting surface (16) comes into close contact with the tapered inner surface (17), the fluid flow hole (38) is closed by the tapered inner surface (17).

5. (Withdrawn) A clamping apparatus, wherein

a central pillar (12) is projected from a reference member (2) so as to be inserted into a hole (5) opened in a movable member (3),

an intermediate member (15) which is radially expandable and contractible is supported on a support hole (92) of the movable member (3) movably along the axis of the support hole (92),

a tapered inner surface (17) constituting the hole (5) is formed on an inner peripheral surface of the intermediate member (15), and a tapered fitting surface (16) allowed to make a tapering engagement with the tapered inner surface (17) is formed on the central pillar (12),

an advancing means (25) which presses the intermediate member (15) in such a direction as to tighten the tapering engagement is provided, and

a fluid flow hole (38) is opened in the tapered fitting surface (16), and when the tapered fitting surface (16) comes into close contact with the tapered inner surface (17), the fluid flow hole (38) is closed by the tapered inner surface (17).

6. (Currently Amended) A clamping apparatus as set forth in ~~any one of claim 1 through claim 5~~, wherein

the fluid flow holes (38) are provided in plurality.

7. (Previously Presented) A clamping apparatus as set forth in claim 6, wherein

the fluid flow holes (38) are provided circumferentially in plurality.

8. (Currently Amended) A clamping apparatus as set forth in claim 1 ~~or claim 2~~, wherein

a housing (9) provided in the reference member (2) is provided with a fluid port (39) for supplying pressurized fluid or discharging fluid,

a fluid passage (40) is provided inside the housing (9) and the fluid passage (40) is connected to the fluid port (39),

the fluid passage (40) is provided with a relay opening (41) in the inclined outer surface (13) of the central pillar (12), and

the fluid flow hole (38) is provided so that one end is opened in the straight outer surface (16) and the other end is opened in the inclined inner surface (17) respectively, and the other end faces the relay opening (41).

9. (Previously Presented) A clamping apparatus as set forth in claim 8, wherein

the fluid flow holes (38) are provided circumferentially in plurality,

the fluid passage (40) is communicatively connected to a groove (42) formed in the circumferential direction in at least either the inclined outer surface (13) of the central pillar (12) or the inclined inner surface (17) of the intermediate member (15), and

each of the openings of the fluid flow holes (38) on the inclined inner surface (17) side faces the groove (42).

10. (Withdrawn) A clamping apparatus as set forth in claim 3, wherein

a housing (9) provided in the reference member (2) is provided with a fluid port (39) for supplying pressurized fluid or discharging fluid,

a fluid passage (40) is provided inside the housing (9), and the fluid passage (40) is connected to the fluid port (39),

the fluid passage (40) is provided with a relay opening (41) in an outer peripheral surface of the central pillar (12), and

the fluid flow hole (38) is provided so that one end is opened in the straight outer surface (16) and the other end is opened in the tapered inner surface (17) respectively, and the other end is connected to the relay opening (41) via a communication hole (79) formed in the inner sleeve (61) in a penetrating manner.

11. (Withdrawn) A clamping apparatus as set forth in claim 10, wherein

the fluid flow holes (38) are provided circumferentially in plurality,

the fluid passage (40) is communicatively connected to a groove formed in the circumferential direction in at least either the inclined outer surface (13) of the inner sleeve (61) or the inclined inner surface (17) of the outer sleeve (71), and

each of the openings of the fluid flow holes (38) on the inclined inner surface (17) side faces the groove.

12. (Withdrawn) A clamping apparatus as set forth in claim 4, wherein

a housing (9) provided in the reference member (2) is provided with a fluid port (39) for supplying pressurized fluid or discharging fluid,

a fluid passage (40) is provided inside the housing (9), and the fluid passage (40) is connected to the fluid port (39),

the fluid passage (40) is provided with a relay opening (41) in an outer peripheral surface of the central pillar (12),

the fluid flow hole (38) is provided so that one end is opened in the tapered fitting surface (16) and the other end is opened in an inner peripheral surface of the intermediate member (15) respectively, and the other end faces the relay opening (41).

13. (Withdrawn) A clamping apparatus as set forth in claim 12, wherein

the fluid flow holes (38) are provided circumferentially in plurality,

the fluid passage (40) is communicatively connected to a groove formed in the circumferential direction in at least either the inner peripheral surface of the intermediate member (15) or the outer peripheral surface of the central pillar (12), and

each of the openings of the fluid flow hole (38) on the inner peripheral surface side of the intermediate member (15) faces the groove.
